Microsoft Powerpoint – a presentation program used to show any subject, idea or topic.

Pages in Powerpoint are called slides and each are customizable and unique. To add new slides, you have 2 options, go to Home tab and click “New Slide” or click the slide on the left and press “Enter” key.

New slides have templates like: Title slide, Content slide, Blank slide, etc., use the one that best fits.

Insert Tab in Powerpoint

- The Insert tab in PowerPoint is very similar to Word when adding shapes, pictures, 3D models and adding effects to them.
- The new thing PowerPoint adds to Insert is the “Links” sections, it allows to Zoom on something, Link to something, or add an Action to something.
  - Action includes Hyperlink, Move to a specific slide, make an object do something, play a sound while doing the action and decide how the action will trigger(mouse click or mouse hover)

Objects and Design Tab

- In Powerpoint, objects is anything we insert on it(a text box, shape, picture, models, audios or videos). You can have as many objects in a slide as long as they fit.
- Design Tab allows you to change the background of your slides either by customizing it or letting the desginer give you ideas.
  - Format Background is more complicated than the Word background.
- Each Object is customizable, it can have it’s own effects, color and actions.

Transitions

- Every time we change slides, you can add a transition to each of them. Makes the passing of each slide look smooth.
- You can find all types of transition in the Transitions Tab.
  - Select the transition you want.
  - Decide if you want to add audio and its time length
  - Decide if you want the slide to transition with a mouse click or Enter or if you want it to do it automatically without clicking or pressing Enter.

Animations and Animation Pane

- There are 3 types of animations: Entrance(Green), Exit(Red) and Emphasis(Yellow)
- Every Object can have it’s own animation and as many animations as you want.
- There is a 4th type of animation called motion, allows to trace a path for an object to follow.
- Every animation can be controlled, edited or moved around in the Animation Pane.
- In the Animation Pane you can switch the order of the animations by just moving them around with the mouse. By default every animation starts with a click or Enter key.

Videos and Audio

- Videos and Audio can be put in powerpoint through the Insert Tab. They must be taken either from the internet or from the files of the computer.
- Video and Audio work best when downloaded or recorded. You can record sounds and videos with your phone and then pass them to the computer.
- You can use a video to have an animated background.
- Videos and Audios both count as animations, they show up in the Animation Pane.

Video Format

- Allows us to edit a video in Powerpoint.
  - You can change the color of it, the shape of it.
  - Audio Format is similar to Video Format.

Playback Tab

- Both Video and Audio have this option
- It allows us to edit the length of the Video and Audio.
- We can loop the video and audio, cut it or decide how long it should last.

Actions

- Actions are used to give any object something to do besides an animation.
- It is used to create interactive objects(make something happen when clicked on or mouse over)
- **This is very important for creating choices story like the one assigned.**

PowerPoint Project Rubric

- Story Created in Powerpoint – 35 pts (5 pts for each paragraph)
- Choices and Actions working – 30 pts (5pts each)
  - Each Choice needs to be represented by online pictures. (3pts for each)
  - Actions working correctly (2pts for each, 1 for having the action and 1 for going to the correct part)
- Transitions on each slide – 5 pts
- Background on each slide- 5 pts
- Animated Background on first slide – 5pts
- Audio on each choice – 10pts

Due Date:
October 25
